

Power on Passage for Cruising Yachts

Water generation is the most effective and reliable method of producing power on passage, easily outperforming either wind or solar generation when the yacht is underway.

For energy security on long passages, deploy the Sail-Gen, and recharge your batteries as you sail.

The Sail-Gen harnesses some of the power captured by the yacht's whole sail plan.

The Sail-Gen's water impeller extracts energy from the yacht's motion through the water.

Quiet and reliable, the Sail-Gen produces enough power to run most, if not all, of your on-board electrics.

Utilising Eclectic Energy's well proven DuoGen-3 technology, the Sail-Gen dedicated water-powered generator is designed specifically to maximise electricity production on passage.
